## **Glasgow Airport Carbon Footprint 2021**

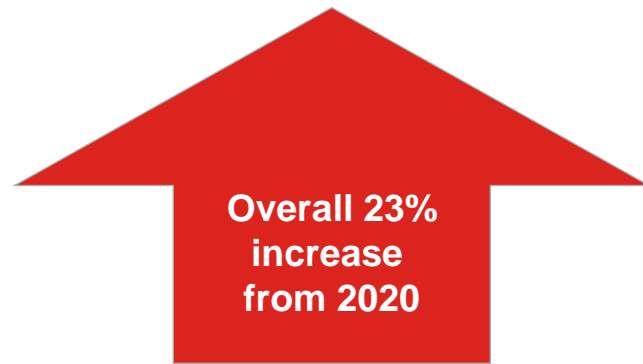

In accordance with the UK Government's Conversion Factors for Company Reporting

Report for Glasgow Airport Limited

## All Scope Emissions = 51,515 tCO<sub>2</sub>e

All emissions are reported in Market Based methodology, unless stated otherwise

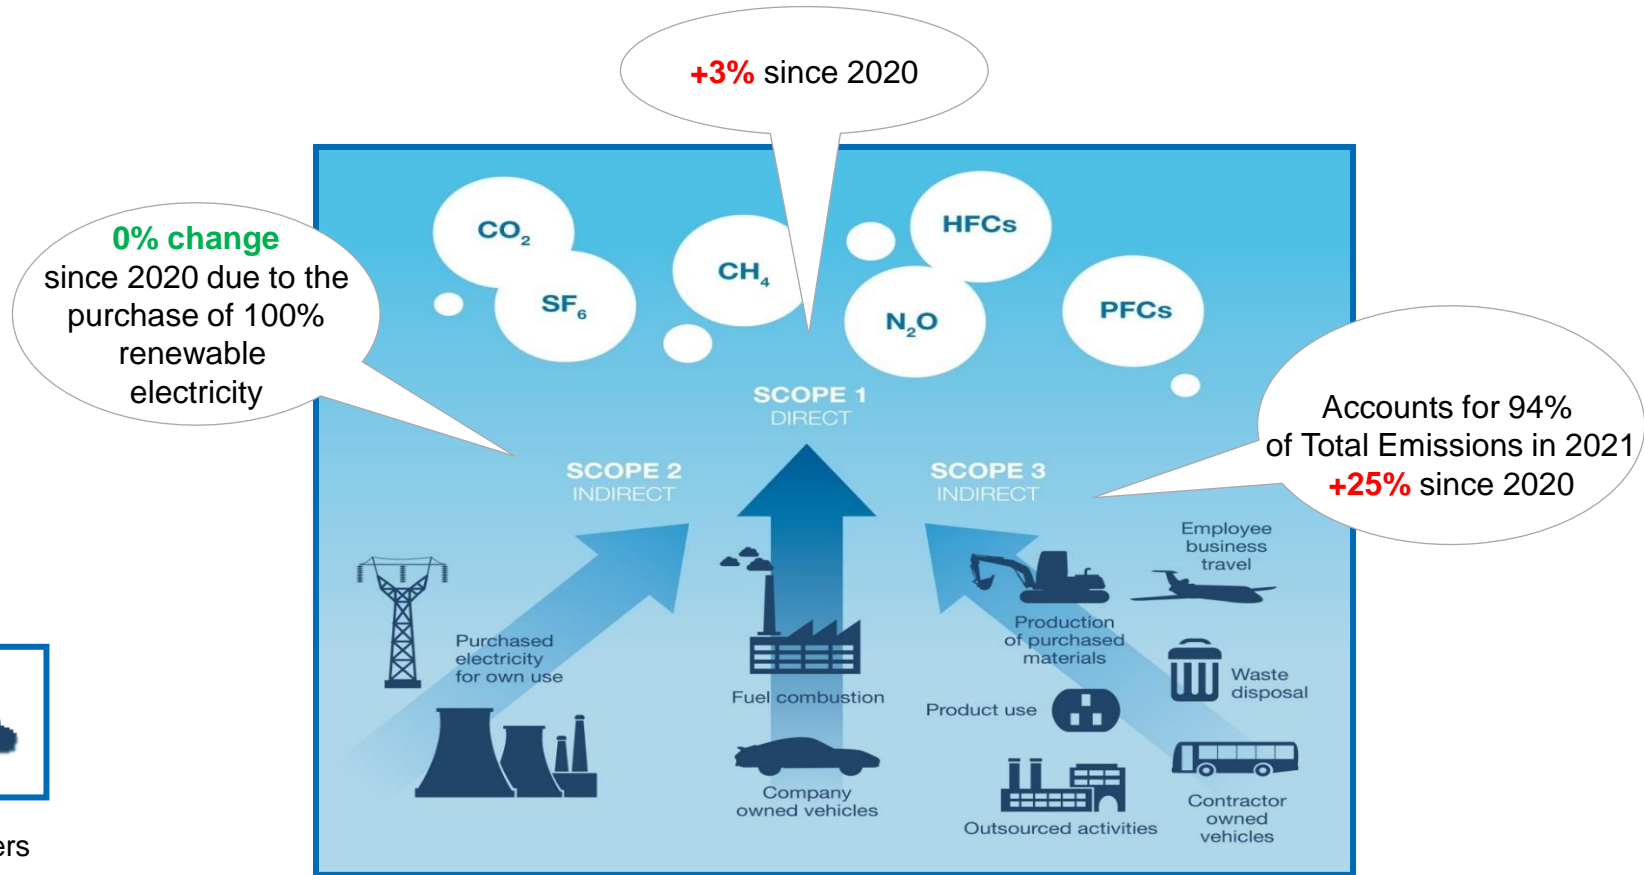

Overall increase is primarily due to national restrictions on travel in 2020 due to the Covid-19 pandemic and the removal of these restrictions in 2021.

Number of aircraft movements have increased by 14.8% since 2020

Passenger numbers have increased by 6.7% since 2020

Scope 1 and Scope 2 emissions have seen an overall increase of **+3%** since 2020. This is likely due to increases in activity returning to pre-pandemic levels.

# Included Emission Sources

The following emissions sources are included in the 2021 carbon footprint for Glasgow Airport:

## Scope 1: Direct Emissions:

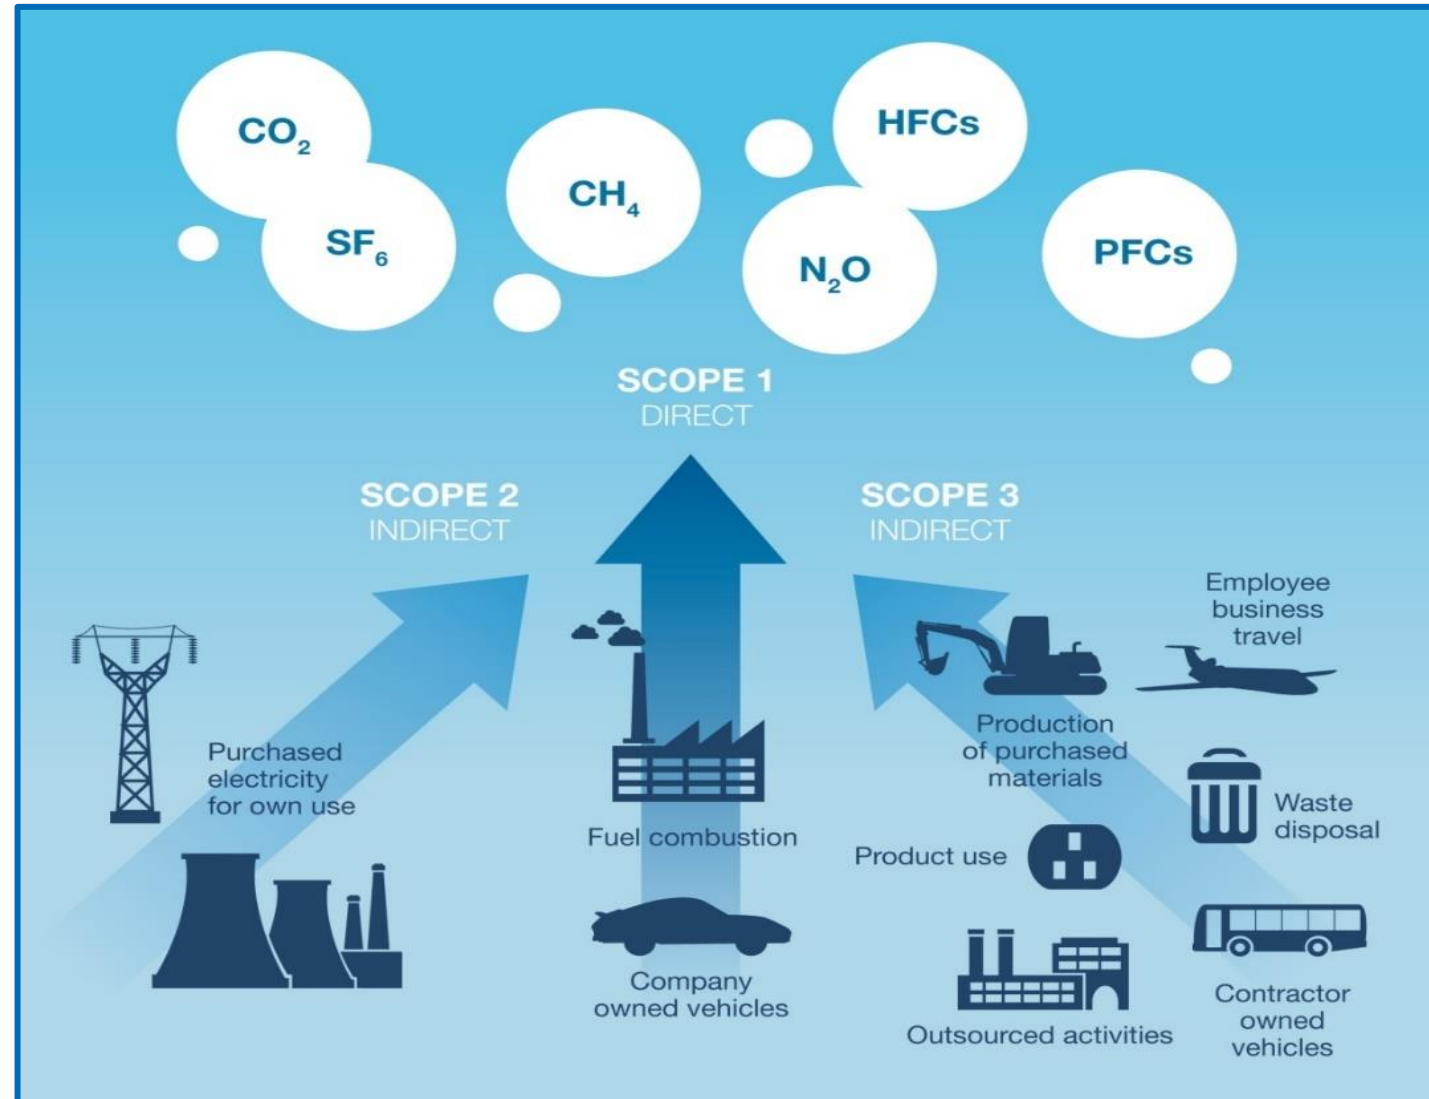

- Fuels burnt on site (boilers, generators, airport owned operational vehicles, fire training)
- Refrigerant gas losses
- Airport glycol based de-icer

## Scope 2: Indirect Emissions:

- Purchased electricity

## Scope 3: Indirect Emissions:

- 3<sup>rd</sup> party operational vehicle fuels
- 3<sup>rd</sup> party glycol based de-icer
- Tenant energy use (sub metered electricity and natural gas recharged to tenants)
- Aircraft LTO cycle, APU usage and engine testing
- Business travel
- Water supply and wastewater treatment
- Staff commute
- Passenger surface access
- Waste disposal and material use

# Key Stats- Carbon Emissions by Scope 2021

	Total 2021 emissions (tCO2e)	% of total emissions
Scope 1	3,007	5.8%
Scope 2	0	0.0%
Scope 3	48,501	94.1%
Outside of Scope	6	0.0%
<b>Total</b>	<b>51,515</b>	<b>100%</b>

### Scope 1:

Emissions on-site, or an associated process, from the combustion of fossil fuels, e.g. natural gas, oil, LPG and company-owned vehicles.

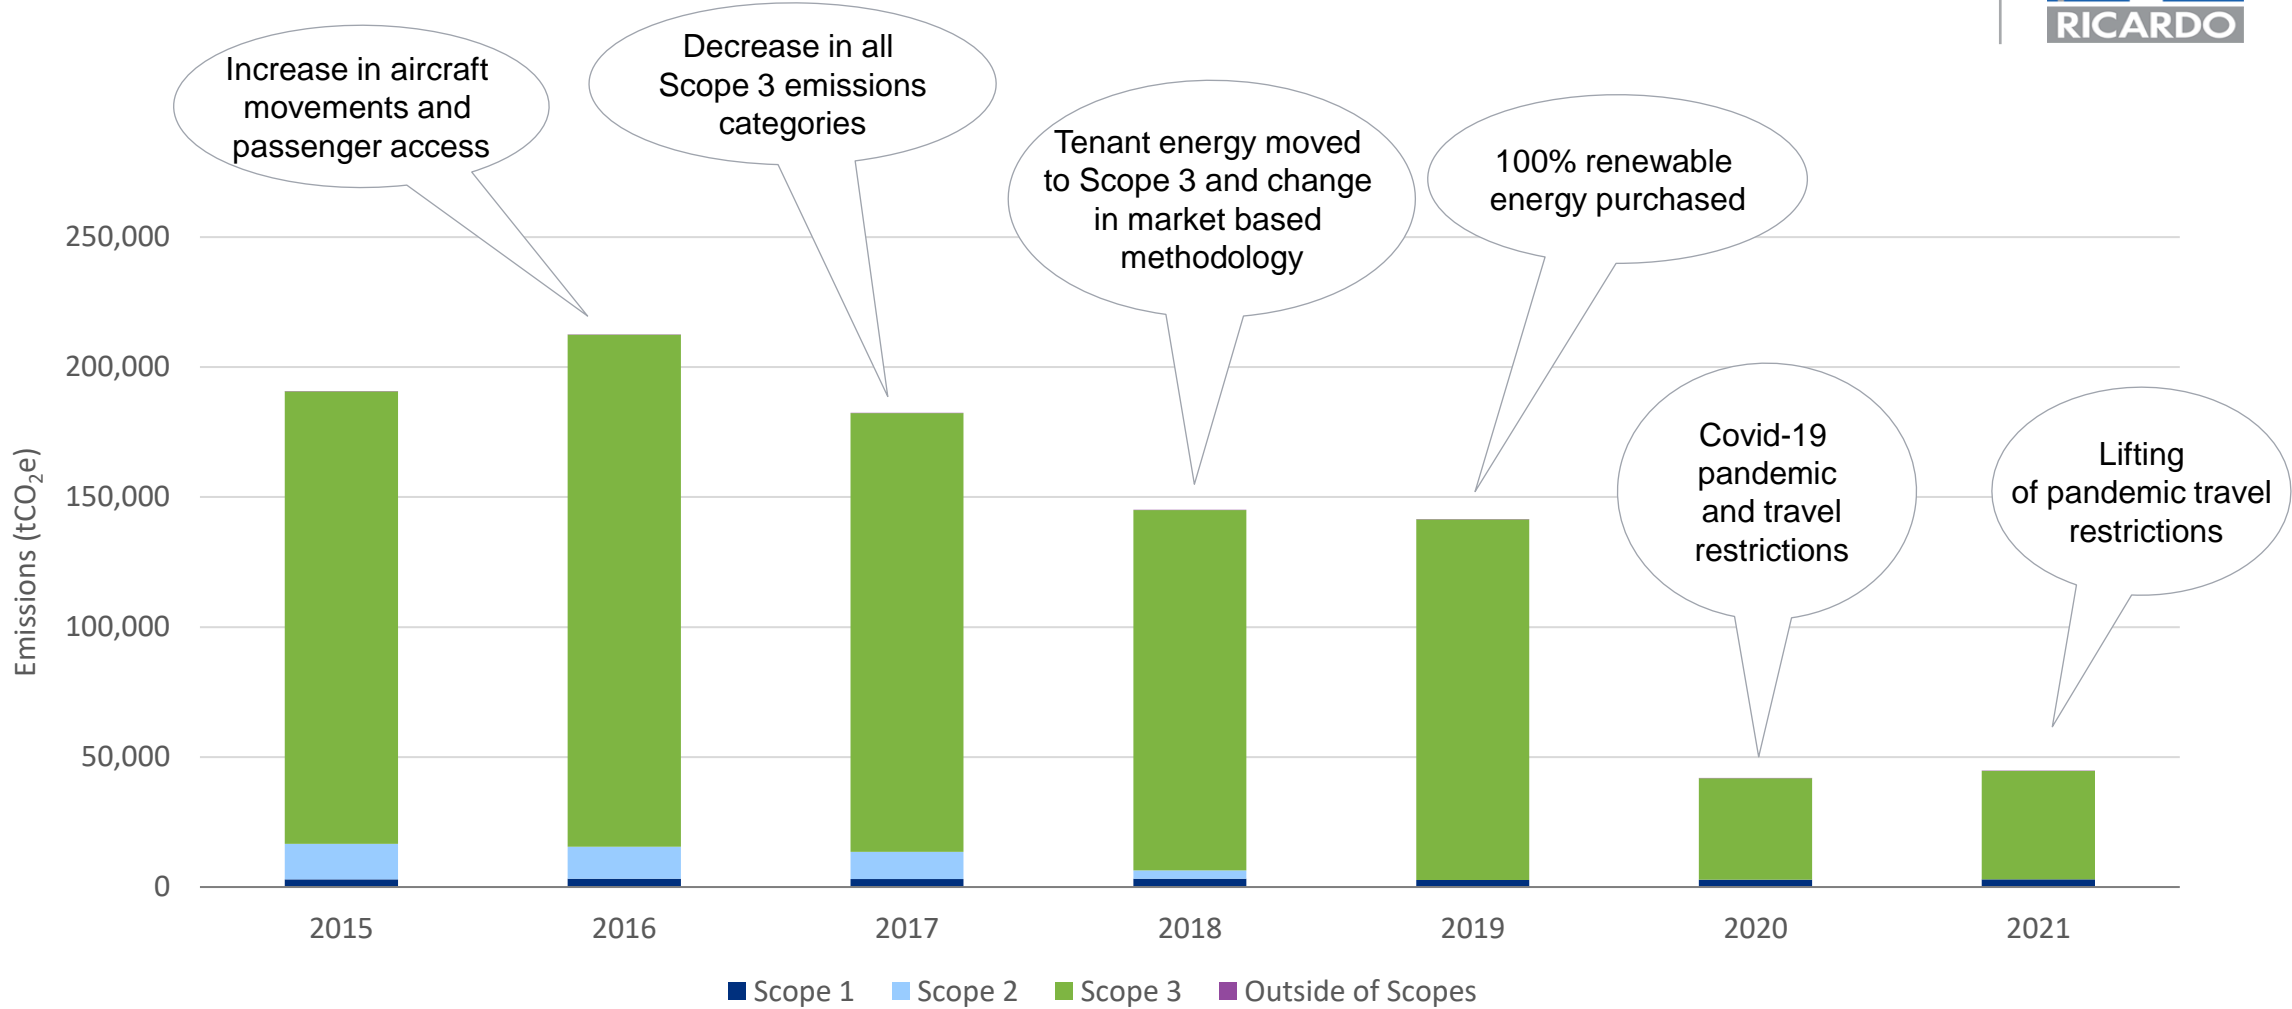

### Scope 2:

Emissions associated with the use of electricity imported from the grid or from a third party supplier of energy in the form of heat or electricity.

### Scope 3:

Scope 3 is a category that includes the emissions from all other indirect sources. Scope 3 emissions are the consequence of the activities of GLA but arise from sources not owned or controlled by GLA. These include; aircraft movements, passenger and staff travel to the airport, airside activities, waste disposal, water, and business travel.

# Key Stats- All Scopes Summary

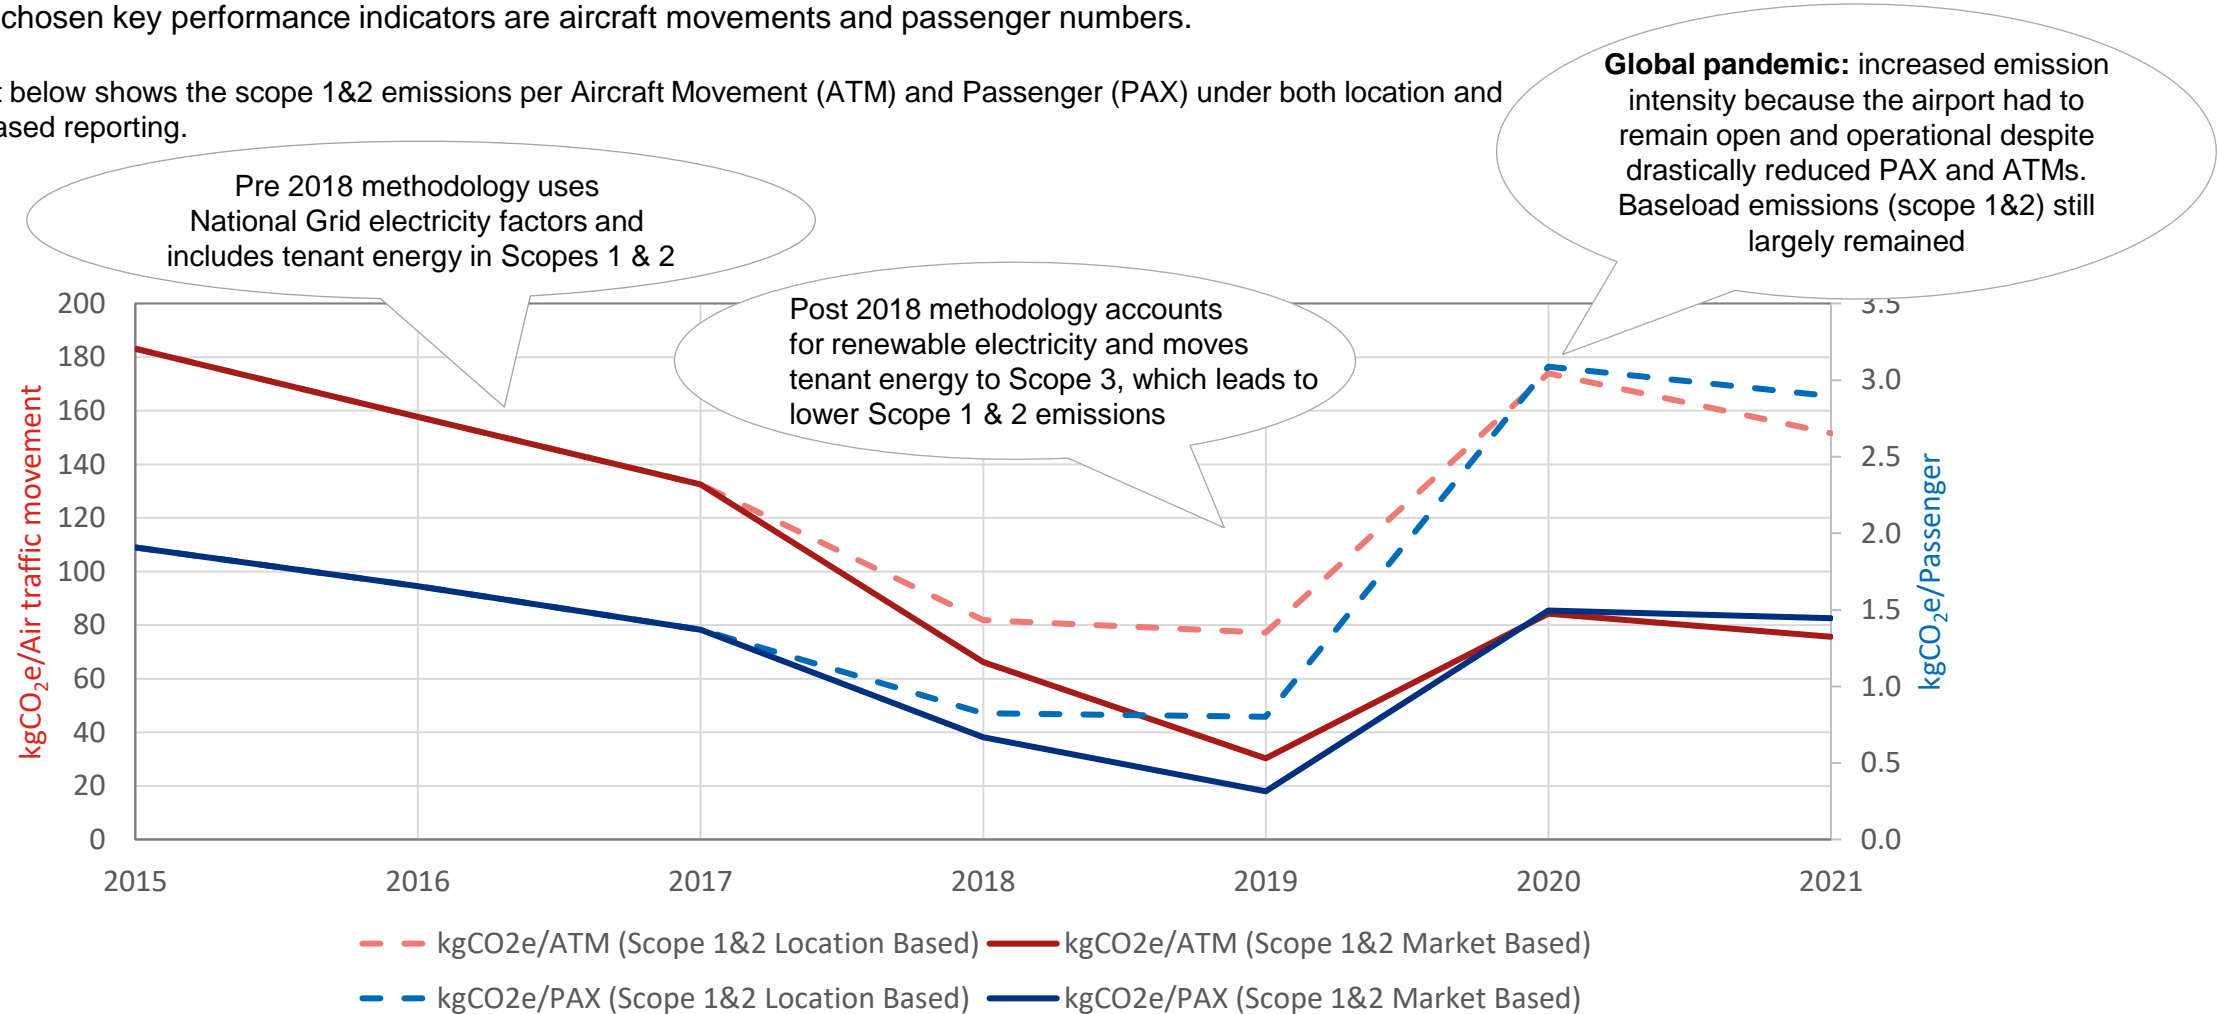

Scope 3 emissions have always been the largest contributor to Glasgow Airport’s carbon footprint. The majority of which are from aircraft activities and passenger access to the airport.

# Key Stats - Intensity Metrics comparison over time - 1

Intensity metrics allow comparison over time against other factors that fluctuate and have an impact on the environmental performance of the airports. The two chosen key performance indicators are aircraft movements and passenger numbers.

The chart below shows the scope 1&2 emissions per Aircraft Movement (ATM) and Passenger (PAX) under both location and market based reporting.

There was a slight decrease in market and location based intensity metrics in 2021. This is likely due to the lifting of travel restrictions enforced in 2020 and an increase in ATM and PX numbers relative to emissions.

## Key Stats - Intensity Metrics comparison over time - 2

The table below shows the figures from the chart on the previous slide for:

- Location based 2 and Tenant Energy in Scope 3 from 2018
- Market based Scope 2 and Tenant Energy in Scope 3 from 2018

	2015	2016	2017	2018	2019	2020	2021
<b>ATM</b>	90,782	98,264	102,490	97,415	91,848	34,589	39,720
<b>PAX</b>	8,718,269	9,370,402	9,902,239	9,659,818	8,850,565	1,947,877	2,078,962
<b>% Change in ATM (year-on-year)</b>	N/A	8.2%	4.3%	-5.0%	-5.7%	-62.3%	14.8%
<b>% Change in PAX (year-on-year)</b>	N/A	7.5%	5.7%	-2.4%	-8.4%	-78.0%	6.7%
<b>Scope 1 &amp; 2 (tCO<sub>2</sub>e) Location Based Tenant energy in Scope 3</b>	16,633	15,500	13,578	7,980	7,091	6,017	6,022
<b>kgCO<sub>2</sub>e/ATM</b>	183.2	157.7	132.5	81.9	77.2	173.9	151.6
<b>kgCO<sub>2</sub>e/PAX</b>	1.9	1.7	1.4	0.8	0.8	3.1	2.9
<b>Scopes 1 &amp; 2 (tCO<sub>2</sub>e) Market Based Tenant energy in Scope 3</b>	N/A	N/A	N/A	6,454	2,788	2,915	3,007
<b>kgCO<sub>2</sub>e/ATM</b>	N/A	N/A	N/A	66.3	30.4	84.3	75.7
<b>kgCO<sub>2</sub>e/PAX</b>	N/A	N/A	N/A	0.7	0.3	1.5	1.4

\*Note that for the years 2015-2017, no figures for this methodology are available.

  - [Glossary](#)

AGS Airports Limited, a partnership between Ferrovial and Macquarie Infrastructure and Real Assets (MIRA), owns Glasgow International Airport Limited (GLA). The airport operates 365 days per year serving around 9 million passengers and handling around 92,000 aircraft movements. AGS Airports employ around 350 full time employees (FTE), of which 184 are based in Glasgow Airport. Many of these commute to the airport by car or public transport, though cycling has become more popular in recent years.

To continue operating in an environmentally responsible manner, it is important for the airport to monitor and manage all its emissions from all operations – both those the airport is directly responsible for, and those it can influence under its scope 3 emissions.

During the reporting year of 2021, national travel restrictions remained in place until spring in response to the Covid-19 pandemic. With the lifting of these restrictions, passenger numbers saw an increase, and as a result so did aircraft movements and the related emissions. The reporting year 2021 saw an increase in aircraft movements, passenger numbers and employee commuting, however these are not yet at pre-pandemic levels.

The calculation of the annual carbon footprint will help AGS Airports Limited and the individual airports understand the different areas which contribute to their overall carbon footprint and monitor changes on a yearly basis. This process will help identify improvement opportunities, which will ultimately reduce AGS Airports' carbon footprint and associated costs. In addition, the success of any management strategies previously implemented can be evaluated.

It is important to understand any changes in emissions that are a direct result of changes in carbon footprint calculation methodology, and not a change in operations. Therefore, for the 2021 carbon footprint there are outlined below:

- WTT Emissions added to Electricity (Scope 3) in carbon footprint calculations in order to better encapsulate the emissions related to using the UK energy grid
- Staff commute emissions were calculated using a pre-covid survey and an average 2021 furlough figure to account for employees on furlough between January-September 2021.
- Business Travel methodology has been updated and improved in both 2020 and 2021 calculations. Estimates were slightly inflated in previous years but have now been corrected.
- Improved calculation methods for passenger surface access emissions was applied to 2019, 2020, 2021 calculations to more accurately show annual emission change
- CCD emissions estimated and reported separately from carbon footprint calculations in order to better encapsulate the emissions from aircraft movements beyond the immediate vicinity of the airport.

# Carbon Emissions by Source and Activity 2021 – 1

Glasgow Airport's emissions can be broken down by activity as seen in this table.

The main activities that contribute to the footprint are aircraft movements, passenger surface access, and utilities.

Utilities include natural gas and refrigerant usage in the terminal, as well as electricity consumption and glycol based de-icer

While not as large as utilities, staff commuting represents nearly 10% of overall emissions.

Waste, fire training and business travel contribute to <1% of the carbon footprint

Emission Source	Scope 1 (tCO <sub>2</sub> e)	Scope 2 (tCO <sub>2</sub> e)	Scope 3 (tCO <sub>2</sub> e)	Outside of Scopes (tCO <sub>2</sub> e)	Total (tCO <sub>2</sub> e)	% of total emissions
<b>Aircraft Movements</b>	0	0	29,060	0	29,060	56.4%
<b>Passenger Surface Access</b>	0	0	12,869	0	12,869	25.0%
<b>Utilities</b>	2,731	0	2,021	0	4,751	9.2%
<b>Staff Commute</b>	0	0	3,325	0	3,325	6.5%
<b>Aircraft Engine Tests</b>	0	0	730	0	730	1.4%
<b>Waste &amp; Material Use</b>	0	0	453	0	453	0.9%
<b>Operational Vehicles</b>	255	0	38	6	300	0.6%
<b>Fire Training</b>	21	0	0	0	21	0.0%
<b>Business Travel</b>	0	0	5	0	5	0.0%
<b>Total</b>	<b>3,007</b>	<b>0</b>	<b>48,501</b>	<b>6</b>	<b>51,515</b>	<b>100.0%</b>

Accounts for the direct carbon dioxide (CO<sub>2</sub>) impact of using biofuels in airport vehicles.

# Carbon Emissions by Source and Activity 2020 – 2

All Scopes carbon emissions split by source/activity

Scopes 1&2 carbon emissions split by source/activity

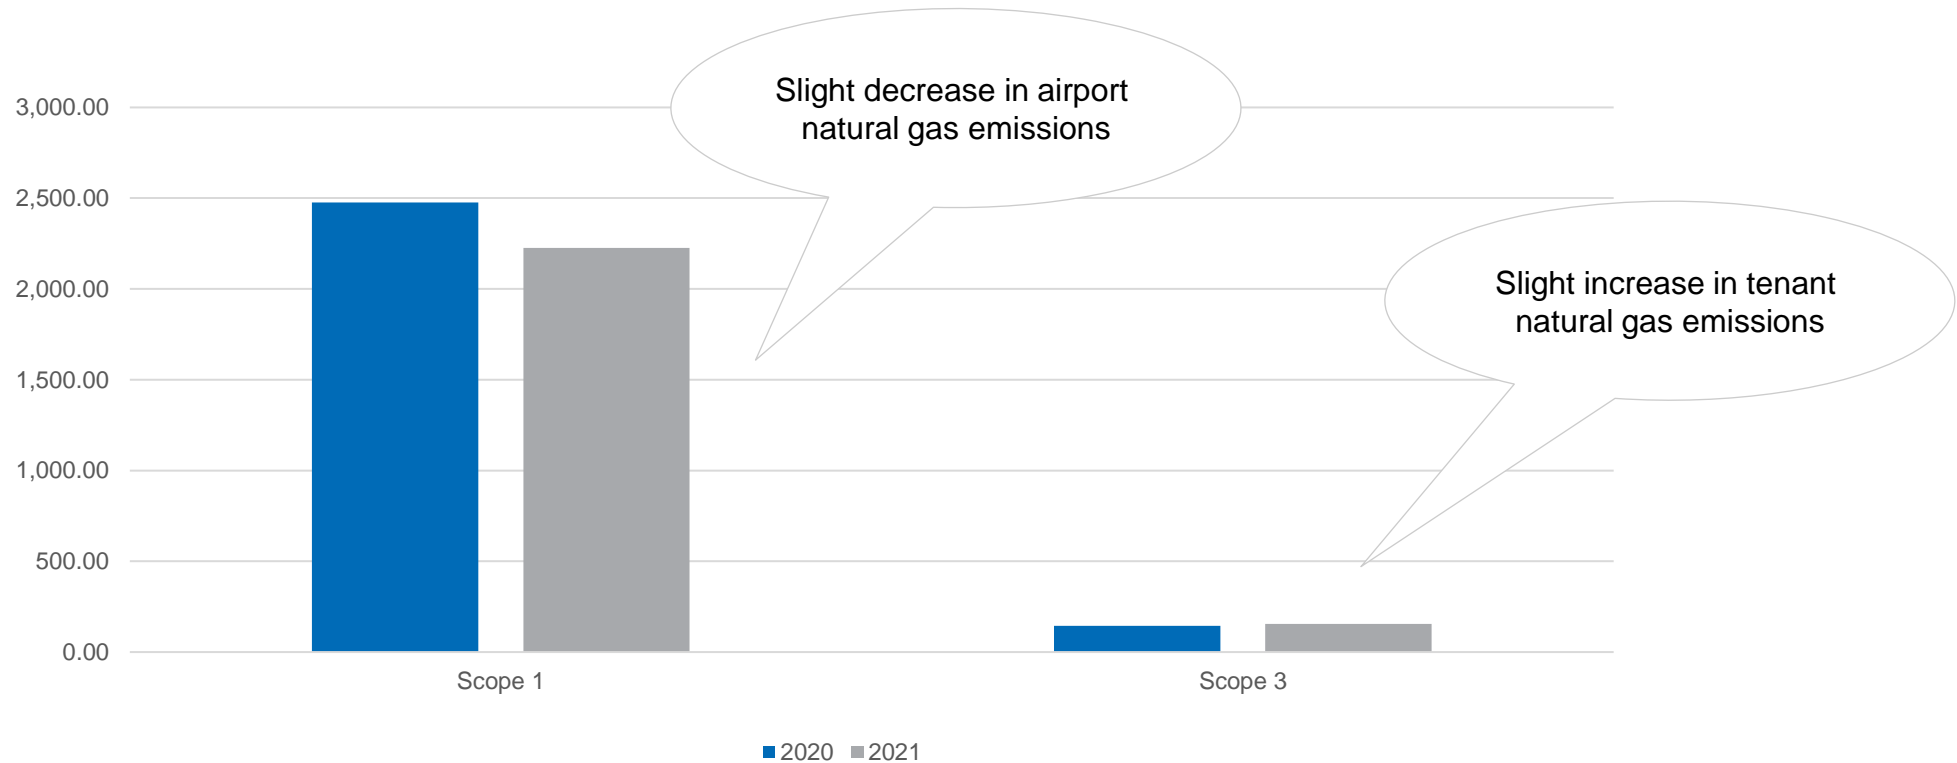

Scope 3 carbon emissions split by source/activity

# Tenant Energy

- As tenant energy is outside the control of the airport, this was moved to Scope 3 emissions in 2019, in order to more clearly identify the airport's controllable emissions.
- All tenant energy that is contained in Scope 3 is sub metered energy that was recharged to tenants.
- A comparison of emissions from natural gas split by scope 1 and 3 (airport and tenant) can be seen below. Electricity is not included in this chart because renewable electricity is purchased and has no associated emissions.

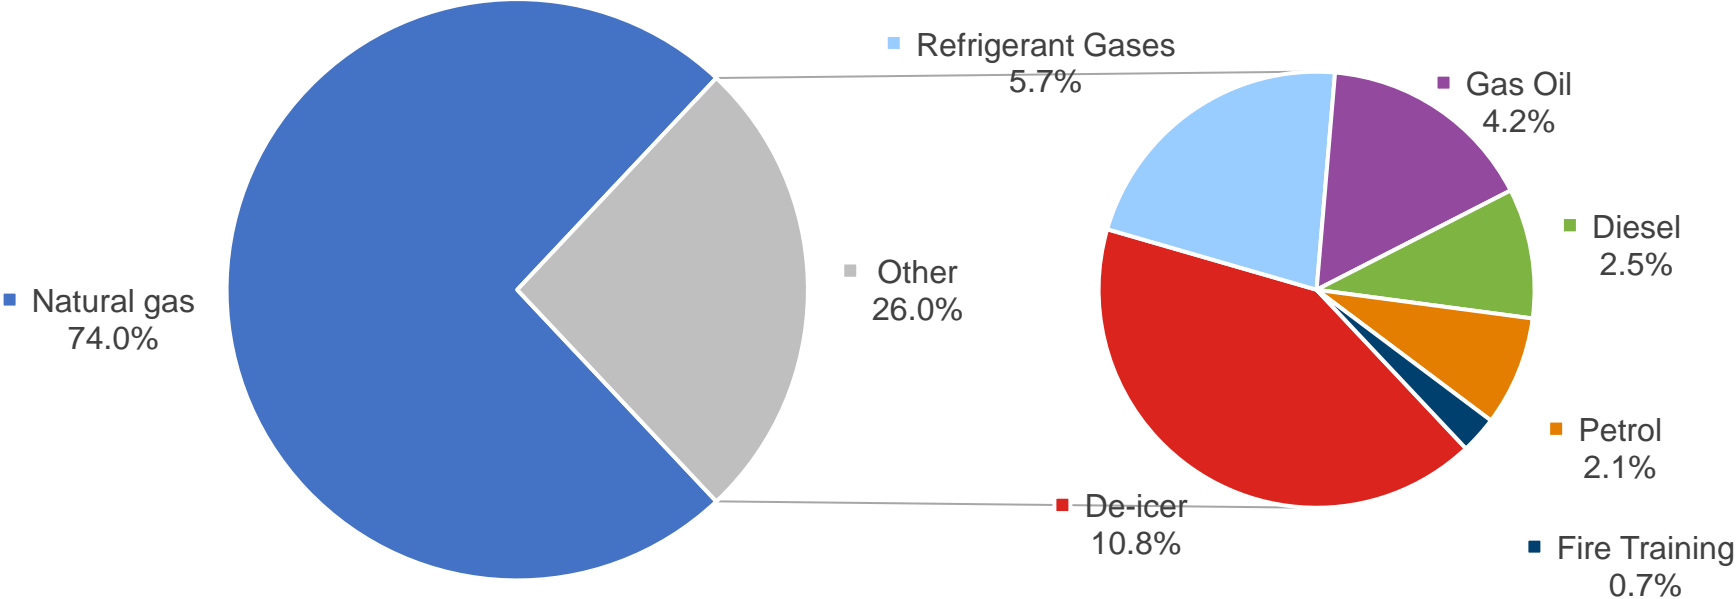

# Scope 1 Emissions Sources

Scope 1 = 3,007 tCO<sub>2</sub>e ( 6.7% of Total)

Scope 1 emissions are those under the direct control of the airport

## Scope 2: Location and Market Based Emissions

Scope 2 = 0 tCO<sub>2</sub>e (0% of total)

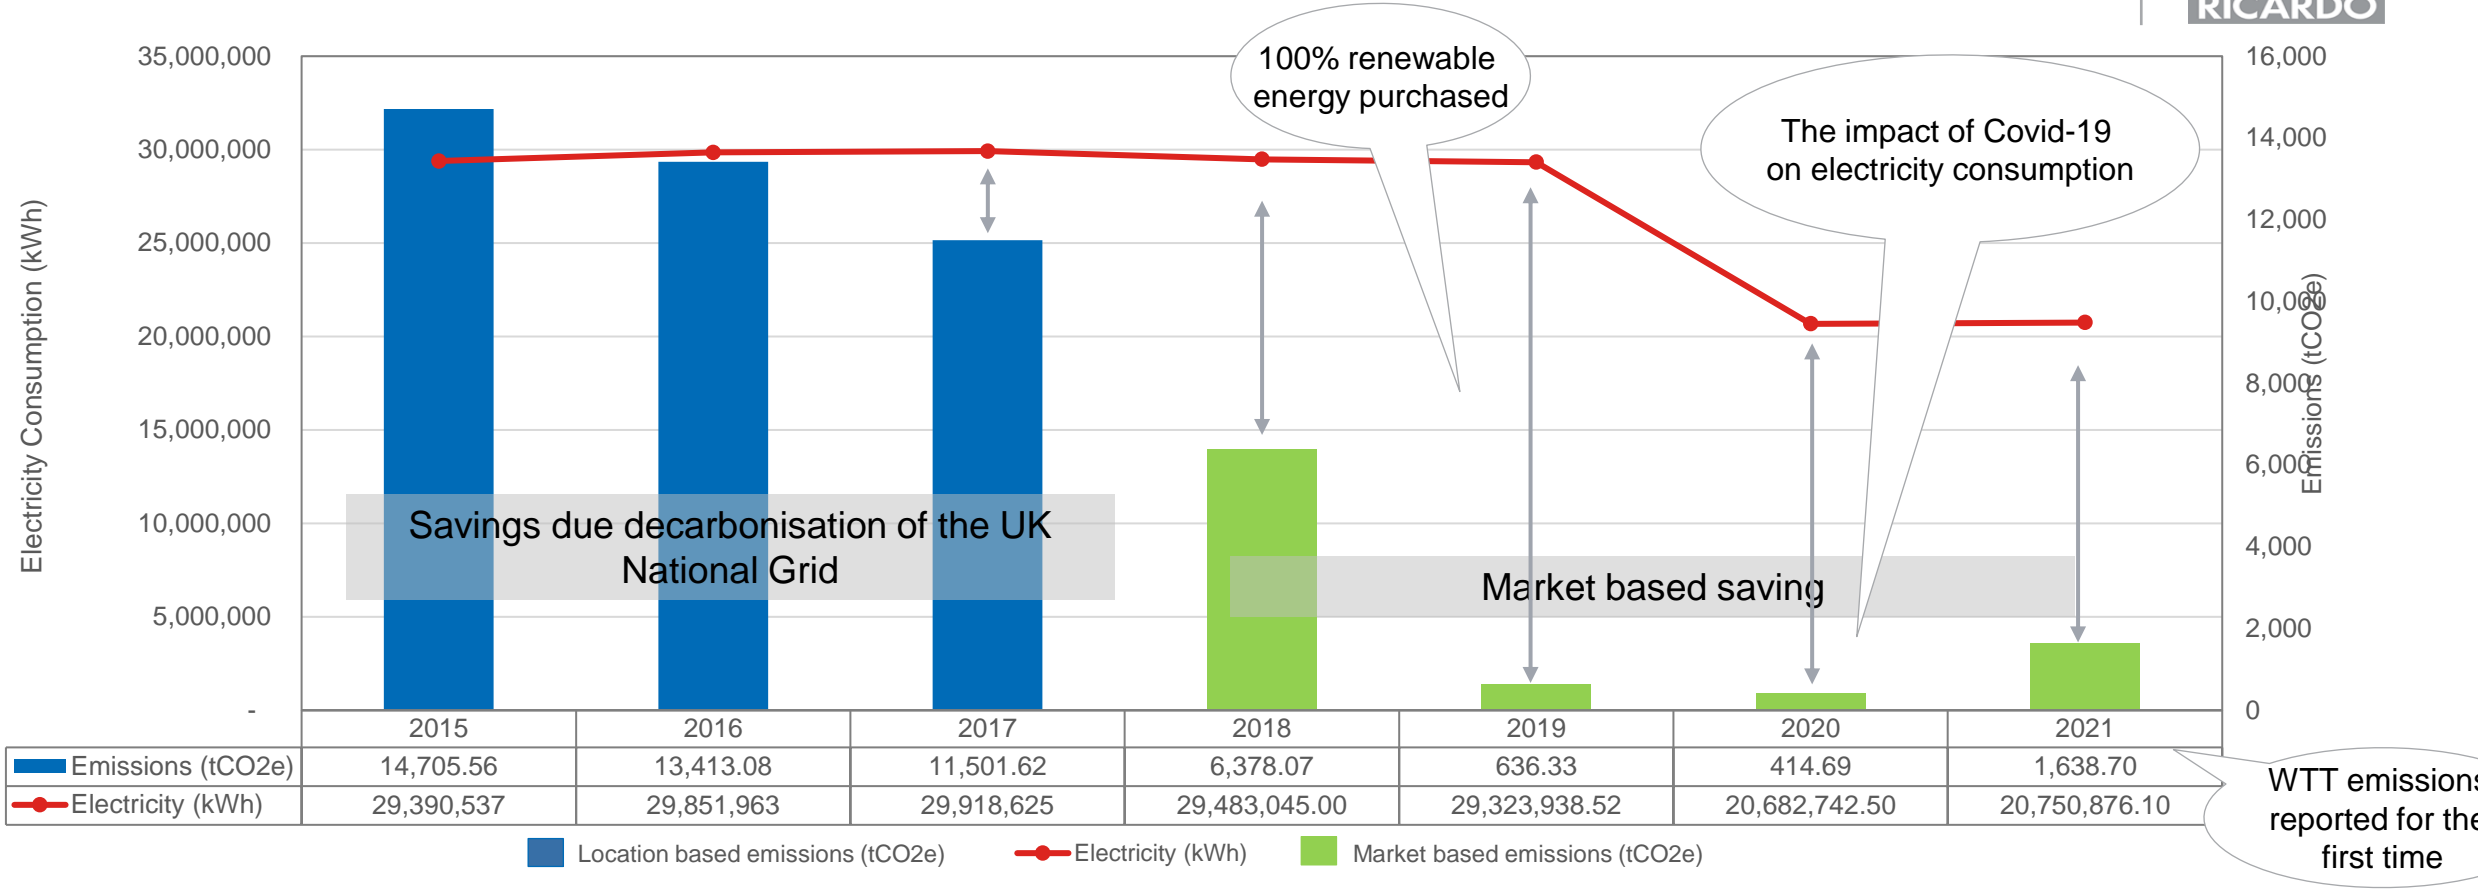

Scope 2 emissions relate to the electricity consumption at the airport. These can be calculated as:

- Location-Based method: This reflects the average emission intensity of the electricity grid where consumption occurs. Companies reporting using this method should use the Regional/National Grid average emission factor. In this UK, this would be sourced from the BEIS UK Government conversion factors for Company Reporting.
- Market-Based method: This reflects the emissions from the electricity that a company is purchasing. Energy suppliers are required under UK law to disclose to consumers the fuel mix and GHG emissions associated with their portfolio or tariffs. This airport chooses to purchase energy that is greener than the National Grid average emissions factor. The advantage of procuring electricity that is higher in renewable energy content than that of the National Grid is outlined in the table below:

	Location-Based (tCO <sub>2</sub> e)	Market-Based (tCO <sub>2</sub> e)
<b>Airport Electricity Emissions (Scope 2)</b>	3,015	0

- Here, Market-Based emissions are zero because the airport purchased 100% green electricity from its energy suppliers. A supplier statement has been provided which indicates that the supply is 100% renewable and REGOs will be available in mid-2022.
- The following slide provides an annual comparison of the electricity consumption and relevant emissions at Glasgow Airport.

# Comparison of Electricity Consumption and Carbon Emissions

There was only a small deviation in total electricity consumption from 2015-2019. The majority of savings in emissions during this period is due to the increase of renewables on the national electrical grid and the purchasing of 100% renewable electricity from 2018. From 2019-2020, electricity consumption and the resulting emissions reduced, likely due to the Covid-19 pandemic. From 2021, electricity consumption increased 6.1% due to the removal of travel restrictions in the latter half of the year. Emissions from electricity have increased largely because of the inclusion of Well-To-Tank (WTT) emissions for the first time in 2021.

Note: to allow for better comparison to previous years, the figures for electricity emissions above include tenant electricity use, as well as Transmission and Distribution (T&D) and WTT emissions.

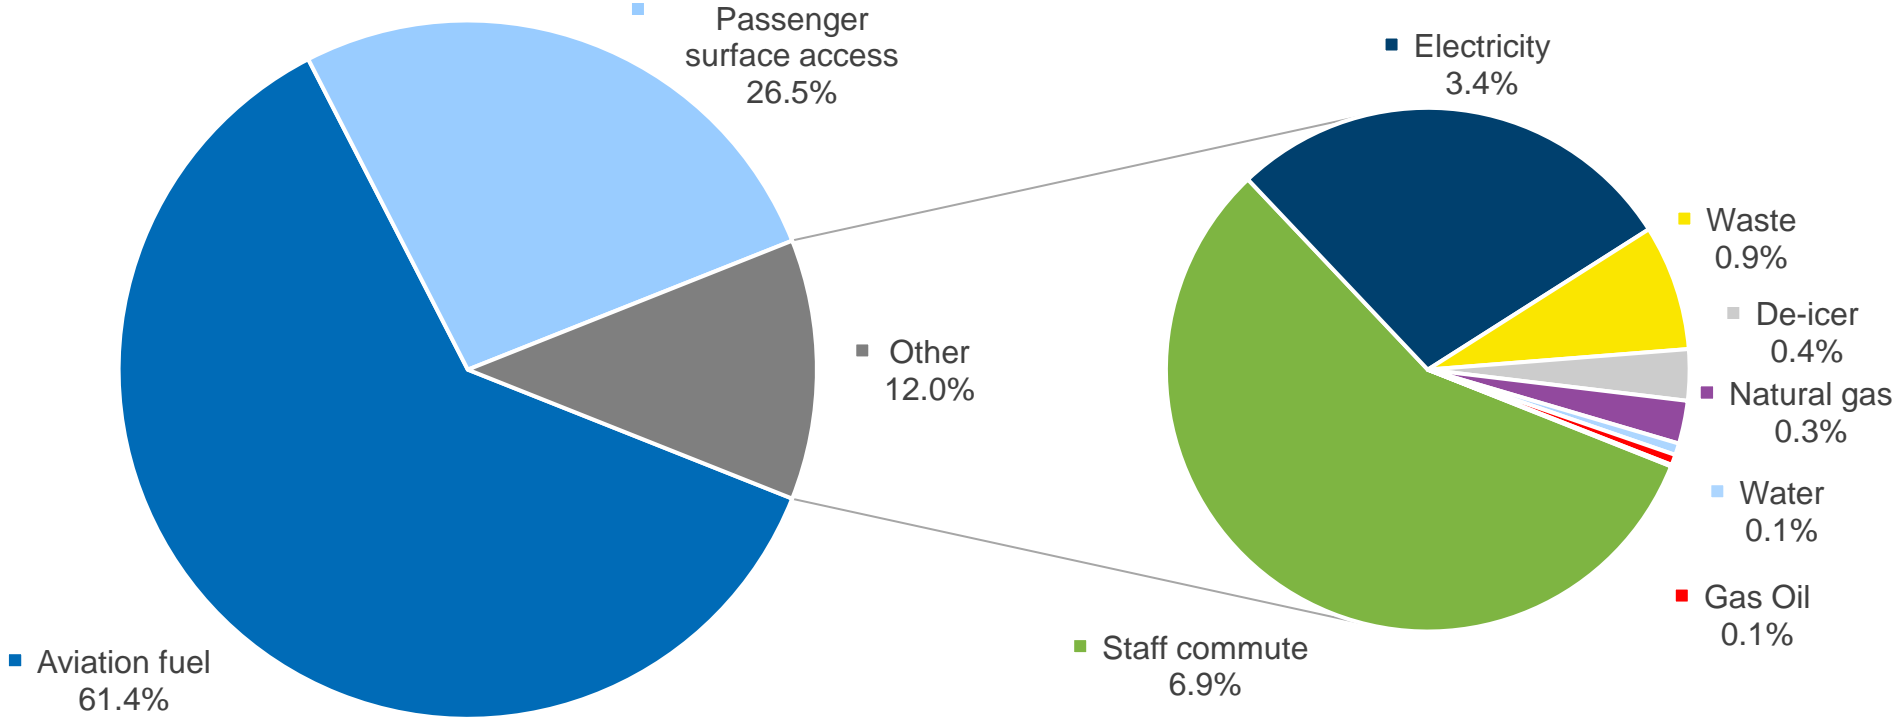

# Scope 3 Emissions Sources

Scope 3 = 48,501 tCO<sub>2</sub>e (94.1% of Total)

Unlike Scope 1 and 2 emissions, those categorised as Scope 3 are not under the direct control of the airport

The Scope 3 figure above for electricity is inclusive of the emissions associated with Transmission and Distribution (T&D) and Well-To-Tank (WTT) only. GLA procures 100% renewable electricity, however, it still receives energy from the UK electricity grid and therefore it is best practice to report these scope 3 emissions. Business Travel contributed 5.36 tCO<sub>2</sub>e, but was removed from this chart as it constituted less than 0.1% of emissions.

Landing Take-Off Cycle (LTO) emissions account for aircraft movements which occur below 3,000 feet during flight. Total LTO emissions for 2021 are **29,060 tCO<sub>2</sub>e**.

EasyJet offset 100% of their aviation fuel emissions as per ACA guidelines and can therefore be claimed as carbon neutral. AGS airports have decided to continue reporting these emissions in their carbon footprint for clarity.

Total emissions from EasyJet that are offset are **7,018 tCO<sub>2</sub>e** which is 24% of total LTO emissions.

# Annual Emissions Trends – 1

## Annual Emissions Trends – 2

The table below shows the figures from the charts on the previous slide, as well as the % year-on-year (y-o-y) change of the different emissions scopes. All emissions below are in tCO<sub>2</sub>e.

Emissions by Scope	2015	2016	2017	2018	2019	2020	2021
Scope 1	3,049	3,199	3,060	3,226	2,788	2,915	3,007
Scope 2	13,584	12,301	10,518	3,228	0	0	0
Scopes 1 & 2	<b>16,633</b>	<b>15,500</b>	<b>13,578</b>	<b>6,454</b>	<b>2,788</b>	<b>2,915</b>	<b>3,007</b>
Scope 3	174,046	196,951	168,734	138,588	138,613	38,916	48,501
Outside of Scope	6	5	5	4	5	7	6
<b>Total</b>	<b>190,684</b>	<b>212,455</b>	<b>182,317</b>	<b>145,046</b>	<b>141,406</b>	<b>41,838</b>	<b>51,515</b>

% y-o-y change							
Scope 1	N/A	5%	-4%	5%	-14%	5%	3%
Scope 2	N/A	-9%	-14%	-69%	-100%	N/A	N/A
Scope 1 & 2	<b>N/A</b>	<b>-7%</b>	<b>-12%</b>	<b>-52%</b>	<b>-57%</b>	<b>5%</b>	<b>3%</b>
Scope 3	N/A	13%	-14%	-18%	0%	-72%	25%
Outside of Scope	N/A	-11%	5%	-19%	23%	32%	-3%
<b>Annual Difference</b>	<b>N/A</b>	<b>11%</b>	<b>-14%</b>	<b>-20%</b>	<b>-3%</b>	<b>-70%</b>	<b>23%</b>

\* Due to changes in methodology, 2015-2017 emissions are reported using location-based methodology and tenant energy is in Scopes 1 and 2. for 2018 onward, emissions are reported using market-based methodology and tenant energy is moved to Scope 3.

Almost all emission sources experienced an **increase** in 2021.

The following sources experiences the largest **decrease** in emissions from 2020, likely due to ongoing impacts of the Covid-19 pandemic:

- Operational Vehicles (Scope 1) **decreased** by 48%
- Business Travel (Scope 3) **decreased** by 77%

The following sources experienced an **increase** in emissions from 2020:

- Utilities **increased** by 31%, largely due to the inclusion of electricity Well-To-Tank (WTT) emissions for the first time in 2021. Excluding WTT emissions, there has been an **decrease** of 4%.
- Passenger Surface Access **increased** by 10%, which is likely due to the lifting of travel restrictions during the year. While the numbers are increasing, they have yet to reach pre-pandemic levels, and are likely to continue to increase in the future as passenger traffic returns to pre- pandemic levels.
- Staff Commute **increased** by 56%, likely due to the end of the furlough scheme. As with Passenger numbers, these numbers are still below pre-pandemic levels, and can be expected to increase in the future.
- Waste has also **increased** by 65%, likely due to increased operations and passenger traffic in the airport since the lifting of travel restrictions in May. These numbers are still below pre-pandemic levels and can be expected to increase in the future.
- Fire Training **increased** by 92%, which was a return to pre-pandemic levels, and likely due to increased operations since the lifting of travel restrictions.
- Aircraft movements **increased** by 25%, due to a 15% increase in movements and also due to less engine types matching to the databases under the advance calculation methodology.
- Engine Testing **increased** by 174% from 2020 to 2021. The number of engine runs increased 369%. The reason the increase in 2021 emissions is not in line with the increase in engine runs is because the average run time in 2020 was 1162 seconds compared to 768 in 2021.

## ED14522

This report is the Copyright of AGS Airports Limited. It has been prepared by Ricardo Energy & Environment, a trading name of Ricardo-AEA Ltd, under contract to customer name dated 09/01/2020. The contents of this report may not be reproduced in whole or in part, nor passed to any organisation or person without the specific prior written permission of AGS Airports Limited. Ricardo Energy & Environment accepts no liability whatsoever to any third party for any loss or damage arising from any interpretation or use of the information contained in this report, or reliance on any views expressed therein.

## Appendix – Calculation Methodologies and Assumptions

This appendix provides an insight into how Ricardo Energy & Environment (REE) has calculated the carbon footprint emissions for Glasgow Airport. To convey this, three questions are answered for each emissions area of Glasgow Airport's carbon footprint:

- How was the CO<sub>2</sub>e figure calculated?
- What was the data that was used?
- Have any assumptions been made?

As per UK Government GHG Conversion Factors for Company Reporting guidance, Outside of Scope factors should be used to account for the direct carbon dioxide (CO<sub>2</sub>) impact of burning biomass and biofuels. The emissions are labelled 'outside of scope' because the Scope 1 impact of these fuels has been determined to be a net '0' (since the fuel source itself absorbs an equivalent amount of CO<sub>2</sub> during the growth phase as the amount of CO<sub>2</sub> released through combustion). As a result, full reporting of any fuel from a biogenic source should have the 'outside of scope' CO<sub>2</sub> value documented to ensure complete accounting for the emissions created.

Out of Scope = 6 tCO<sub>2</sub>e (0.01% of total emissions)

The following sections provide a summary of the methodology adopted by Ricardo Energy & Environment to calculate the 2021 carbon footprint for the Airport.

The standard approach to carbon footprinting is to use the Greenhouse Gas (GHG) Protocol Corporate Accounting and Reporting Standard developed by World Business Council for Sustainable Development (WBCSD) and the World Resources Institute (WRI); this sets out a corporate accounting and reporting methodology for GHGs.

**Scope 1 emissions** are defined as direct GHG emissions arising from sources that are owned or controlled by the company. The emissions result from activities that the company can have direct influence on through its actions. Airports' emissions that are included are: natural gas use, company owned vehicles fuel use, fuel use for refrigerant gas use (from leaks during maintenance or malfunction), wood pallets and diesel use for fire training, propane combustion and kerosene combustion.

**Scope 2 emissions** are associated with the use of electricity imported from the grid or from a third-party supplier of energy in the form of heat or electricity. These indirect GHG emissions are due to upstream emissions from the production and delivery of fuel to power stations. Airports can influence the amount of electricity it uses; however, it has little control over the generation of the electricity and these emissions are therefore classed as Scope 2.

**Scope 3 emissions** is a category that includes the emissions from all other indirect sources. Scope 3 emissions are the consequence of the activities of GLA but arise from sources not owned or controlled by GLA. Airports do have some influence over Scope 3 emissions but the activities are not under its control. Sources included by Airports include aircraft (all aircraft movements up to a height of 1,000m above aerodrome level, and half the distance travelled between the airport and the origin/destination), employees commuting to the airport, passenger surface access to the airport, airside vehicle activities by third party operators, waste disposal and material supply (including production of the virgin materials), water (supply and treatment) and airport business travel.

The uncertainties associated with carbon footprint calculations can be broadly categorised into scientific uncertainty and estimation uncertainty. Scientific uncertainty arises when the science of the actual emission and/or removal process is not completely understood. For example GWP values involve significant scientific uncertainty. Estimation uncertainty arises any time GHG emissions are quantified. Estimations have been made within this footprint where areas of uncertainty have arisen.

## **Business Travel**

Accounts data was provided for business travel (Scope 1 & 3). All transport mode data was provided in £ value and converted to distance travelled using the cost/km from Carbon Footprint and Project Register Tool (CFPRT) which can be found at <https://sustainablesotlandnetwork.org/resources/carbon-footprint-and-project-register-tool> . The CFPRT collates cost data for all forms of public transport across the UK, and is managed and updated by Sustainable Network Scotland and Resource Efficient Scotland.

## **Passenger Surface Access**

Emissions are based on a survey undertaken in 2018, scaled to 2021 GLA passenger numbers. Information was collated on the mode of travel and location of those who answered the survey. Methodology has been improved in the 2020 and 2021 calculations.

## **Staff Commute**

For staff commute, a 2021 survey completed by airport and third party staff was utilised to reflect staff commute during and after the Covid-19 furlough scheme. This includes staff commute for both GLA and AGS staff. There were 105 complete responses from airport staff, and so final data was scaled up to the full 248 staff. There were also 149 responses for third party employees, which was scaled up to the full 3,348 active third party passes. The survey respondents provided information on their modes of transport, distance travelled to work and number of days worked per week. The survey included questions on these before and during the Covid-19 pandemic, including time on furlough. An assumption was made that the first 39 weeks of the year were affected by the furlough scheme and the following 13 weeks weren't. An average of 19% of employees were marked as furloughed, and so furlough commute data was adjusted to be in line with this.

## De-icer

We have calculated de-icer emissions using the emissions factors provided in the latest version of the ACERT tool from the Airport Carbon Accreditation scheme. This includes the emissions from glycol based de-icer only, under ACA methodology. Where diluted glycol was used (e.g. 50:50 glycol to water), the dilution rate has been taken into account in calculations to ensure only the amount of undiluted glycol was considered.

## Engine Tests

To calculate the emissions from engine testing at Glasgow airport, a similar process was carried out to identify the engine type as per the LTO cycle detailed on the next slide. Data was provided giving the length of each test and other identifying information for each engine tested. Other assumptions used for the calculations are:

1. It was assumed that two engines were tested in absence of further information within the data to be conservative and maintain assumptions used previously
2. High power testing occurred for 10% of the full test time

## Aircraft Movements: Landing and Take off cycle (LTO)

Data provided by Glasgow airport included the following information for each aircraft movement in 2021: Carrier, Aircraft registration, aircraft IATA code, aircraft ICAO code, engine type, arriving/departing, date of movement and hold time.

This data is used to identify the number and type of engines that each aircraft has, and the fuel burn per second at each stage of the landing take-off cycle (shown below highlighted in green) can be referenced from the latest version of the [ICAO databank](#). The LTO cycle covers the time idling on the runway, distance spent in taxi, and both ascent and descent between the ground and 1,000 m.

**Market-based method:** All of the 20,750,876 kWh of electricity consumption was supplied to Aberdeen Airport by a single supplier. Glasgow Airport contacted the supplier in 2021 and asked for the details of the fuel mix. The following breakdown was provided for the year-ending 31<sup>st</sup> March 2021 (Source of Electricity, Percentage):

- **Renewables - 100%**

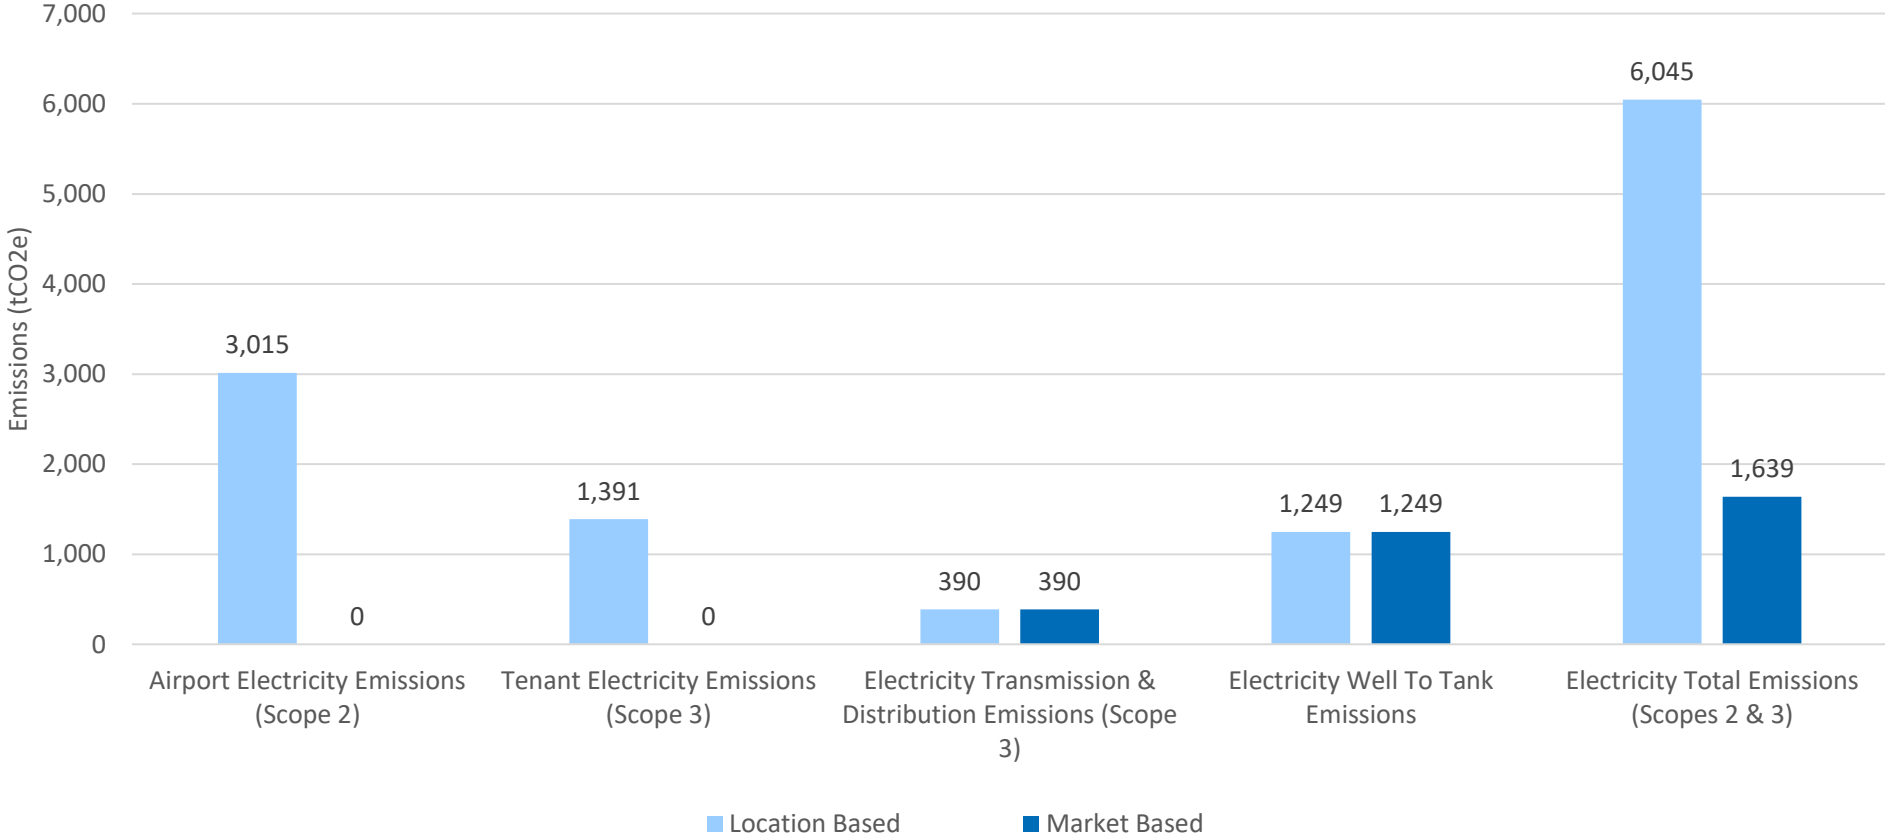

A supplier statement has been provided, which indicates that the supply is 100% renewable and REGOs will be available in mid-2022.

The weighted emission factor was provided as 0 gCO<sub>2</sub>/kWh (or 0 kgCO<sub>2</sub>/kWh). Multiplying the electricity consumption of 12,606,103 kWh by the emission factor of 0 kgCO<sub>2</sub>/kWh calculates the emissions as 0 tCO<sub>2</sub>e.

# Location vs Market Based Emissions 2021

Scope 2 and 3 emissions due to electricity consumption (airport and tenant), calculated using either the location or market based emissions factors.

# Location Based Electricity Emissions Historical Comparison

To allow for a fair comparison to previous years, the figures for electricity emissions below include tenant electricity use (classified as Scope 3 in 2020 methodology).

	2017 (Location Based)	2018 (Location Based)	2018 (Market Based)	2019 (Location Based)	2019 (Market Based)	2020 (Location Based)	2020 (Market Based)	2021 (Location Based)	2021 (Market Based)
Electricity (Scope 2 and 3) kgCO <sub>2</sub> e/kWh <u>Airport (Scope 2) + Tenants (Scope 3)</u>	0.35156	0.28307	0.19220	0.25560	0	0.23314	0	0.21233	0

WTT= Well-To-Tank

# Location vs Market Based Emissions 2021: All Scopes

Emissions totals by scope calculated using either the market or location based emissions factors. Tenant energy is included in Scope 3.

# Historical Emissions Trends: Location Based

The table below shows emissions figures where for all years Scope 2 emissions are reported using the location based methodology and tenant energy is included in Scope 2 for 2015-17 and in Scope 3 from 2018-21. All emissions below are in tCO<sub>2</sub>e.

By Scope	2015	2016	2017	2018	2019	2020	2021
Scope 1	3,049	3,199	3,060	3,226	2,788	2,915	3,007
Scope 2	13,584	12,301	10,518	4,754	4,303	3,101	3,015
Scopes 1 & 2	16,633	15,500	13,578	7,980	7,091	6,017	6,022

Term	Definition
<b>Well-To-Tank (WTT)</b>	Well-To-Tank Emissions. The emissions relating to the extraction, refinement, and transport of fossil fuels, including those used for electricity generation.
<b>Air Traffic Movements (ATM)</b>	Air traffic movements – an aircraft take-off or landing at an airport. For airport traffic purposes one arrival and one departure is counted as two movements.
<b>Carbon dioxide equivalent (CO<sub>2</sub>e)</b>	The carbon dioxide equivalent (CO <sub>2</sub> e) allows the different greenhouse gases to be compared on a like-for-like basis relative to one unit of CO <sub>2</sub> . CO <sub>2</sub> e is calculated by multiplying the emissions of each of the six greenhouse gases by its 100-year global warming potential (GWP).
<b>Carbon footprint</b>	A carbon footprint measures the total greenhouse gas emissions caused directly and indirectly by a person, organisation, event or product. A carbon footprint is measured in tonnes of carbon dioxide equivalent (tCO <sub>2</sub> e).
<b>Transmission &amp; Distribution Losses (T&amp;D)</b>	Transmission & Distribution Losses. Emissions relating to electrical losses within the UK National Grid.
<b>Emission factor</b>	An emissions factor is a representative value that attempts to relate the quantity of a pollutant released to the atmosphere with an activity associated with the release of that pollutant.
<b>Greenhouse Gas (GHG)</b>	Greenhouse gas – a gas in an atmosphere that absorbs and emits radiation within the thermal infrared range. This process is the fundamental cause of the greenhouse effect. The primary greenhouse gases in Earth's atmosphere are water vapour, carbon dioxide, methane, nitrous oxide, and ozone.
<b>Outside of Scope (OoS)</b>	<p>All fuels with biogenic content (e.g. 'Diesel and petrol (average biofuel blend)') should have the 'Outside of Scope' emissions reported to ensure a complete picture of an organisations' emissions are created.</p> <p>The emissions are labelled 'Outside of Scope' because the Scope 1 impact of these fuels has been determined to be a net '0' (since the fuel source itself absorbs an equivalent amount of CO<sub>2</sub> during the growth phase as the that CO<sub>2</sub> is released through combustion).</p>
<b>Passenger Surface Access (PAX)</b>	Number of passengers.
